

IMPORT DATA USING TRANSFORM MAPS (SPREADSHEET)

ServiceNow Project Journey Map • Employee Spreadsheet Import & Transformation

JOURNEY STAGE	1. Open ServiceNow	2. Load Spreadsheet	3. Create Import Set Table	4. Create Transform Map	5. Map Fields	6. Run Transform	7. Validate Data
Interactions	Open the assigned ServiceNow lab instance and access the Application Navigator.	Go to All → Load Data . Choose File and upload the spreadsheet.	Set Label to Employee Import ; staging table name is u_employee_import .	Click Create Transform Map ; define source and target tables.	Map spreadsheet fields such as Employee ID, Name, Email, Department and Location.	Run the transform to move staged records into the target employee records.	Check loaded data, target records and the Import Log for successful processing.
Things / Touchpoints	ServiceNow instance, Application Navigator, browser.	Load Data form, spreadsheet file, Sheet number, Header row.	Import Set Table, Label, Name, staging table.	Transform Map form, Source table, Target table.	Field Maps, source fields, target fields.	Run Transform action and import set.	Target records, Loaded Data and Import Log.
Positive moments	Quick access to the ServiceNow lab environment.	Spreadsheet gives a structured source for bulk employee data.	The staging table is created after submission.	Transform Map gives a clear source-to-target process.	Mappings make field relationships easy to understand.	Bulk transformation reduces manual record creation.	Validation confirms the data reached the target.
Negative moments	Application navigation may be confusing at first.	Wrong file, sheet or header settings can affect loading.	The correct target table may be difficult to identify.	Source and target configuration must be accurate.	Similar field names can make mapping confusing.	Transform errors can occur because of incorrect mappings/data.	Errors require checking logs and source records.
Areas of opportunity	Provide a short All → Load Data navigation guide.	Use a clean spreadsheet with consistent headers.	Clearly document the expected staging table settings.	Clearly identify the correct target table.	Provide a simple field-mapping checklist.	Add validation before running the transform.	Provide an easy checklist for Import Log troubleshooting.
Goals & motivations	Help me reach the correct import function quickly.	Help me upload employee data without formatting mistakes.	Help me store uploaded data in a temporary staging table.	Help me connect staged data to the correct employee table.	Help me map every spreadsheet field correctly.	Help me transform records accurately and efficiently.	Help me confirm successful import and identify errors.

PROJECT FLOW	ServiceNow Instance	→	Application Navigator	→	Load Data	→	Import Set Table	→	Transform Map	→	Field Maps	→	Run Transform	→	Validate
